

Markham Wheel Loader Training

Markham Wheel Loader Training - The two most common types of heavy equipment training are categorized into the categories of machines; equipment which is fashioned with tracks and those with rubber tires. The tracked vehicle are heavy duty equipment like for instance excavators, cranes, and bulldozers. They make up the most common kind of heavy equipment training. Typically, the rubber tire training includes the rubber-tired types of cranes, earth movers and end loaders. Heavy equipment training also includes using different vehicles with rubber tires like for example dump trucks, graders and scrapers. Training centers often offer truck driver training for the many types of heavy equipment training.

Most heavy machinery operates on diesel fuel and as such, the basics of diesel mechanics are a major part of heavy equipment training. Often, a basic course on diesel mechanics is typically required of trainees. Among the main goals of the program are to be able to teach an operator on maintenance procedures and basic troubleshooting in case of a problem with the machine. Often, this training saves a mechanic from being called out in the middle of nowhere just because a piece of machine requires the addition of something minor such as engine oil. Diesel mechanics for heavy machines is an education all unto its own; hence, extensive training is not normally provided in the course book for the general training course.
